13. Other: ____.

12. Note the attached Information Disclosure Statement(s). (PTO/SB/08) Paper No(s).

Continuation of 11. does NOT place the application in condition for allowance because:

Applicants submit that McEwen does not specifically teach how many steps are needed for all survivor paths to merge. Examiner submits that McEwen discloses of a target polynomial as discussed on the Final Rejection OA where L is the length (steps) and M is the number of states.

Applicants submit that the combination of McEwen, Akiyama, Abu -Rgeff and Fisher does not disclose of the Viterbi detection means providing robust tolerance of phase uncertainty with the widely varying amplitude waveform. Applicants submit that Fisher discloses of an error generator to provide input to timing control circuitry which in turns adjusts the sampling phase of the sampler. Examiner submits that Fisher discloses that in order to properly equalize and detect the user -data bits, several parameters must be adaptively controlled error generator. The error generator compares the sample values at node 54 with the ideal target r esponse values (in accordance with the target polynomial) to provide an error signal to the timing control circuit which in turn adjusts the phase. It is clear that a Viterbi detection means through and error generator provides robust tolerance of phase un certainty with the widely varying amplitude waveform.
